Classes and Objects in Java

More details: Public vs. Private
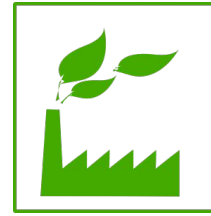

By the end of this video you will be able to...

- Describe what the keywords public and private mean and their effect on where variables can be accessed
- Explain what getters and setters are and write them in your classes

```
public class SimpleLocation
{
    public double latitude;
    public double longitude;
```

public means can access from any class

```java
public class LocationTester
{
  public static void main(String[] args)
  {
      SimpleLocation ucsd =
          new SimpleLocation(32.9, -117.2);
      SimpleLocation lima =
          new SimpleLocation(-12.0, -77.0);

      lima.latitude = -12.04;          allowed

      System.out.println(ucsd.distance(lima));
  }
}
```

```java
public class SimpleLocation
{
    // …
    public double distance(SimpleLocation other)
    {
        // Body not shown
    }
```

```java
public class LocationTester
{
  public static void main(String[] args)
  {
      SimpleLocation ucsd =
          new SimpleLocation(32.9, -117.2);
      SimpleLocation lima =
          new SimpleLocation(-12.0, -77.0);

      lima.latitude = -12.04;     allowed

      System.out.println( ucsd.distance(lima) );
  }
}
```
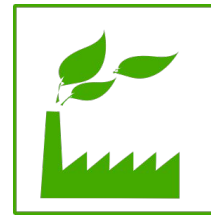

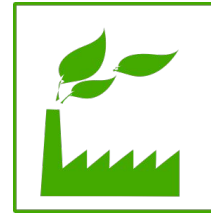

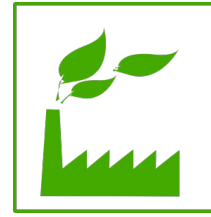

```java
public class SimpleLocation
{
    private double latitude;
    private double longitude;

    public S...
    {
        this.latitude = lat;
        this.longitude = lon;
    }
}
```

private means can access only from SimpleLocation

```java
public class SimpleLocation
{
    private double latitude;
    private double longitude;

    public SimpleLocation(double lat, double lon)
    {
        this.latitude = lat;
        this.longitude = lon;
    }
}
```

allowed

```
public class LocationTester
{
  public static void main(String[] args)
  {

      SimpleLocation ucsd =
          new SimpleLocation(32.9, -117.2);
      SimpleLocation lima =
          new SimpleLocation(-12.0, -77.0);

      lima.latitude = -12.04;        ERRO
                                       R
      System.out.println(ucsd.distance(lima));
  }
}
```
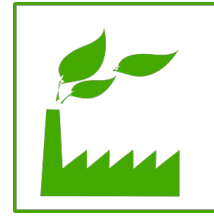

```
public class SimpleLocation
{
        private double latitude;
        private double longitude;
```
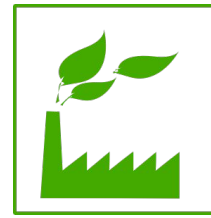

Rule of thumb: Make member variables private
(and methods either public or private)

```java
public class SimpleLocation
{
    private double latitude;
    private double longitude;

    public double getLatitude()
    {
        return this.latitude;
    }
```

getter

```java
public class LocationTester
{
  public static void main(String[] args)
  {
      SimpleLocation ucsd =
          new SimpleLocation(32.9, -117.2);
      SimpleLocation lima =
          new SimpleLocation(-12.0, -77.0);

      System.out.println(lima.latitude));     ERROR
  }
}
```

```
public class LocationTester
{
  public static void main(String[] args)
  {

      SimpleLocation ucsd =
          new SimpleLocation(32.9, -117.2);
      SimpleLocation lima =
          new SimpleLocation(-12.0, -77.0);

      System.out.println(lima.getLatitude()));
  }
}
```
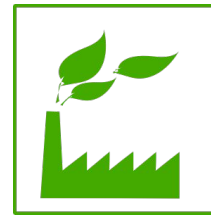

allowed

```java
public class SimpleLocation
{
    private double latitude;
    private double longitude;

    public double getLatitude()
    {
        return this.latitude;
    }
    public void setLatitude(double lat)
    {
        this.latitude = lat;
    }
}
```

setter

```java
public void setLatitude(double lat)
{
    if (lat < -180 || lat > 180) {
        System.out.println("Illegal value for latitude");
    }
    else {
        this.latitude = lat;
    }
}
```
